

# Introduction to Unix

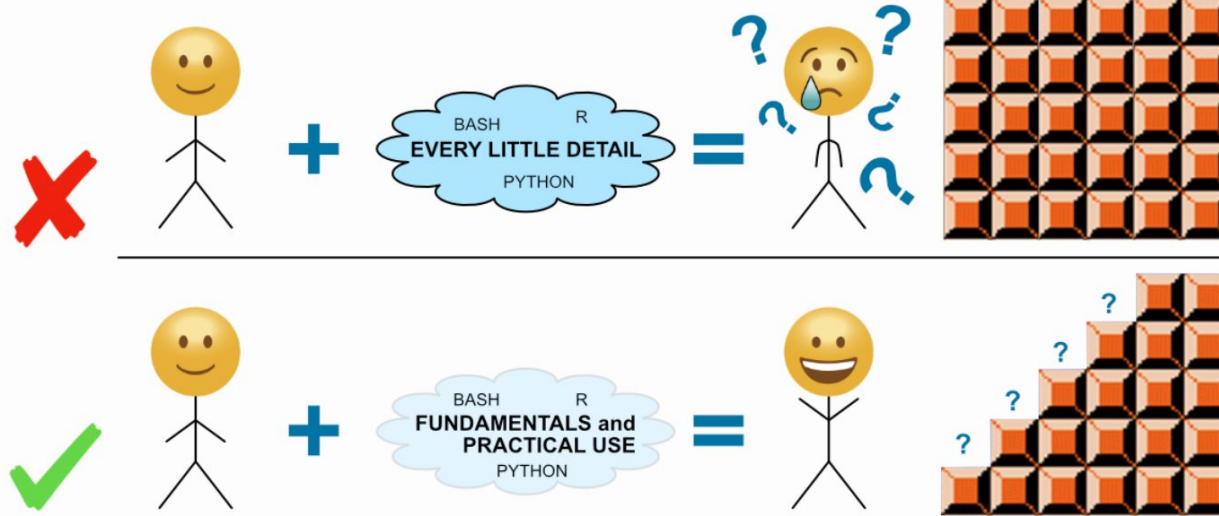

## Part 1

Summer 2021

Emilie Skoog

# Before we start

## My journey into bioinformatics

**NOTE:** Maybe the most important thing to keep in mind while going through these pages is that this is all about *exposure*, not memorization or mastering anything. Don't worry about the details! Starting to build a foundation of fundamentals will allow us to figure out more details for specific things when we need to 😊

# Terms to go over

- Unix
- Bash
- Terminal (shell)
- Command line
- CLI vs GUI
- Directory

# What is Unix?

- **Unix** is an operating system (aka a software that supports a computer's basic functions)
- **Bash** is the most common language used in **Unix**

# Why do we care?/ Why is it important?/ Why learn Unix?

- it's the foundation for most of bioinformatics (and much more)
- enables the use of non-GUI (Graphical User Interface) tools
- reproducibility
- quickly perform operations on large files (without reading into memory)
- automation of repetitive tasks (need to rename 1,000 files?)
- enables use of higher-powered computers elsewhere (server/cloud)

# What is a terminal (or shell)?

- A **terminal** is the program that is used to access files on your laptop/computer that is sitting in front of you (local machine) or access to files on a supercomputer (HPC) in a different location (remote machine).

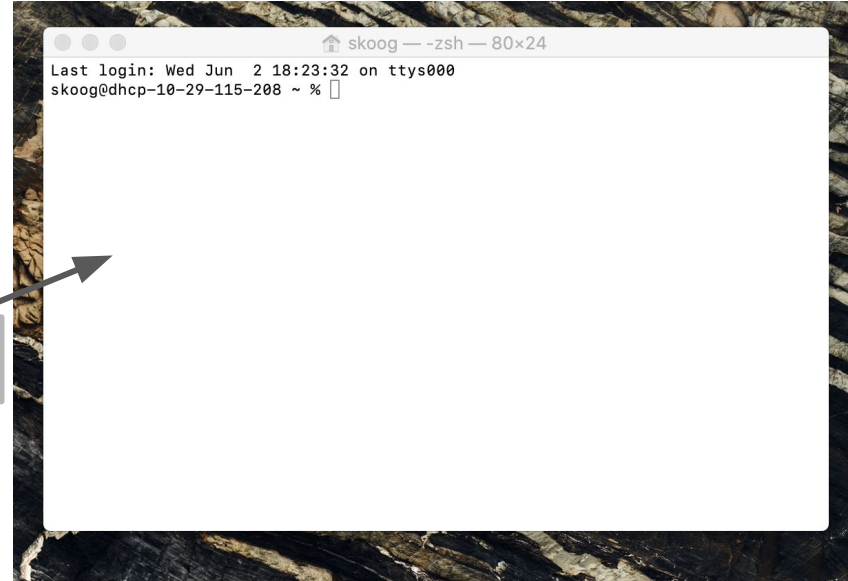

Terminal

# What is a terminal (or shell)?

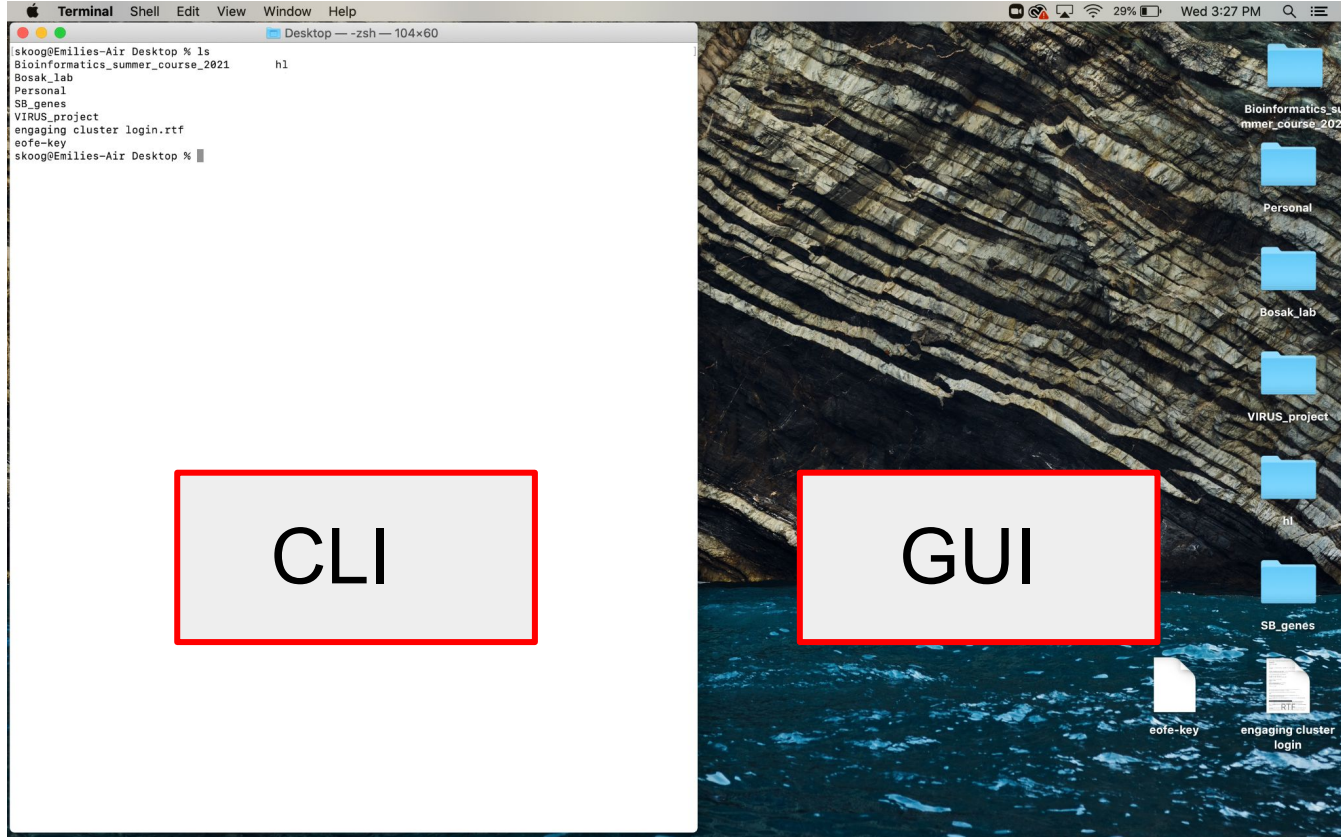

- A **terminal** is the program that is used to access files on your laptop/computer that is sitting in front of you (local machine) or access to files on a supercomputer (HPC) in a different location (remote machine).

Terminal

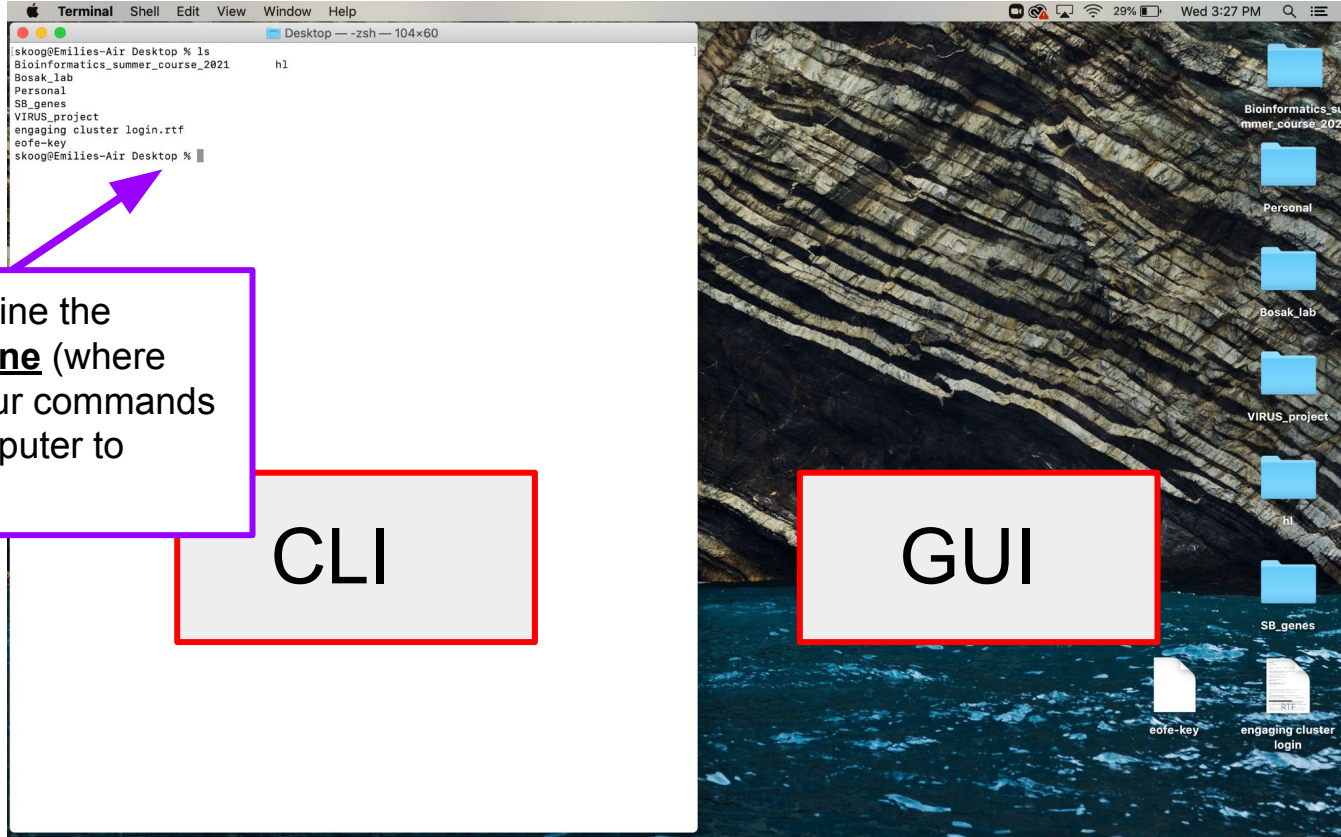

Term	What it is
<code>shell</code>	what we use to talk to the computer; anything where you are pointing and clicking with a mouse is a <b>Graphical User Interface (GUI)</b> shell; something with text only is a <b>Command Line Interface (CLI)</b> shell

# Command line interface (CLI) vs graphical user interface (GUI)

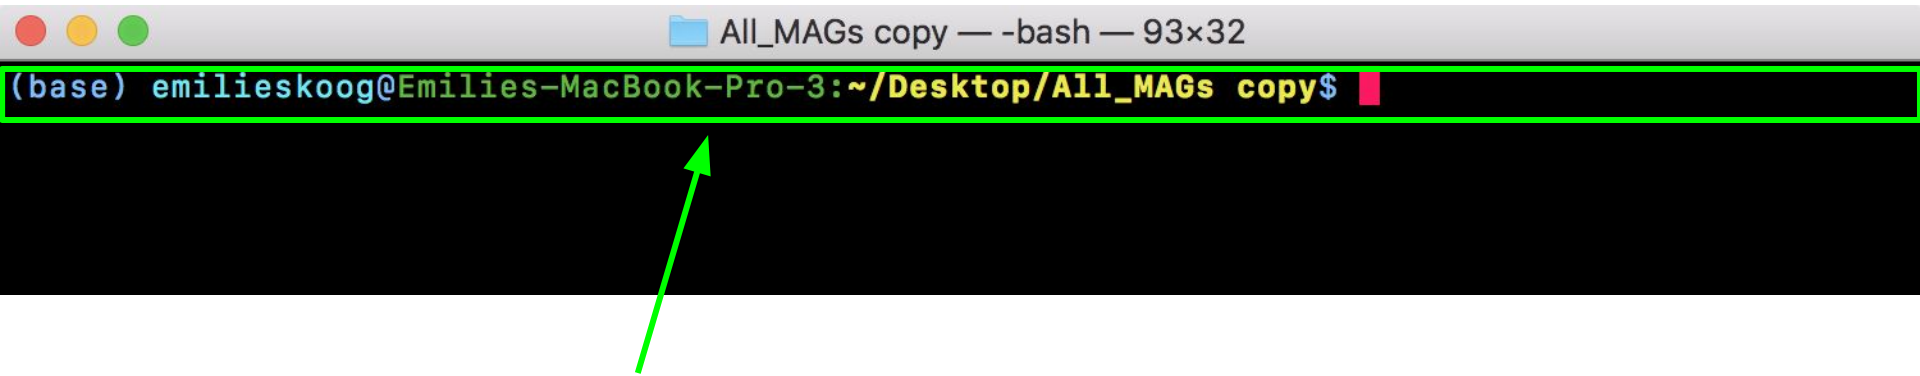

# Command line interface (CLI) vs graphical user interface (GUI)

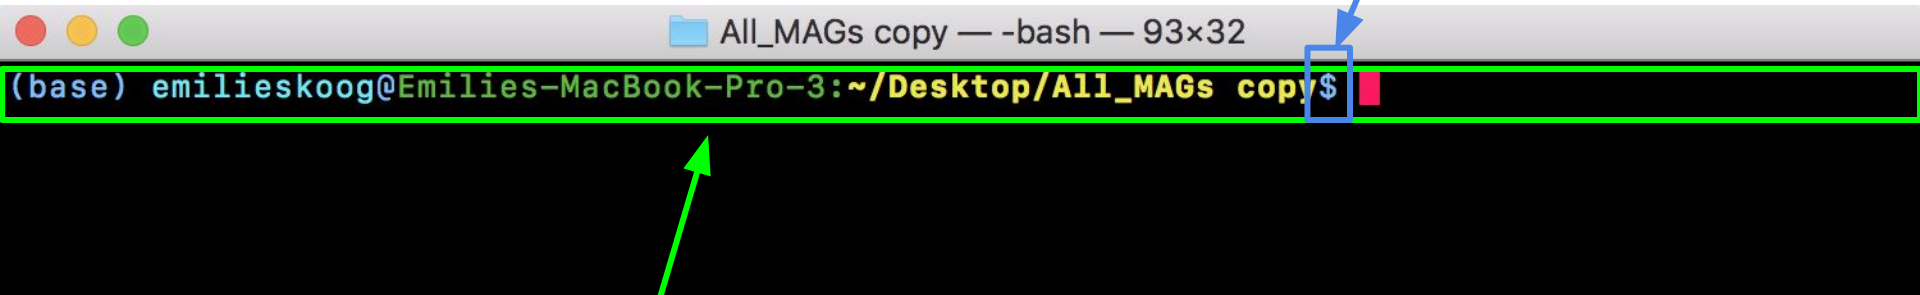

# Command line

Command line

# Command line

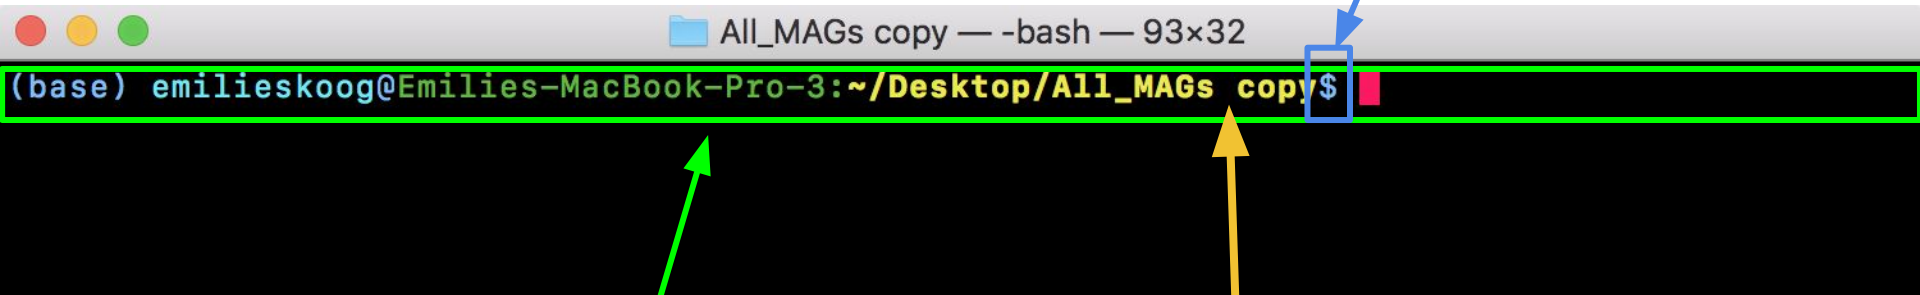

Right after the \$ is where you start typing

Command line

# Command line

Right after the \$ is where you start typing

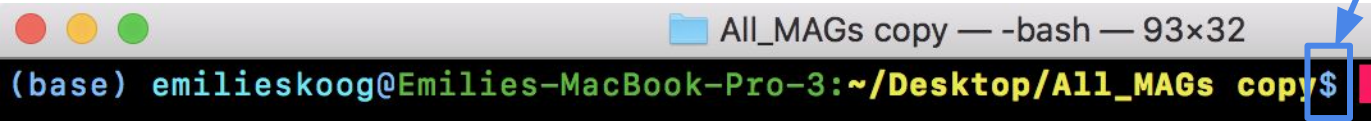

Command line

Avoid spaces in naming files

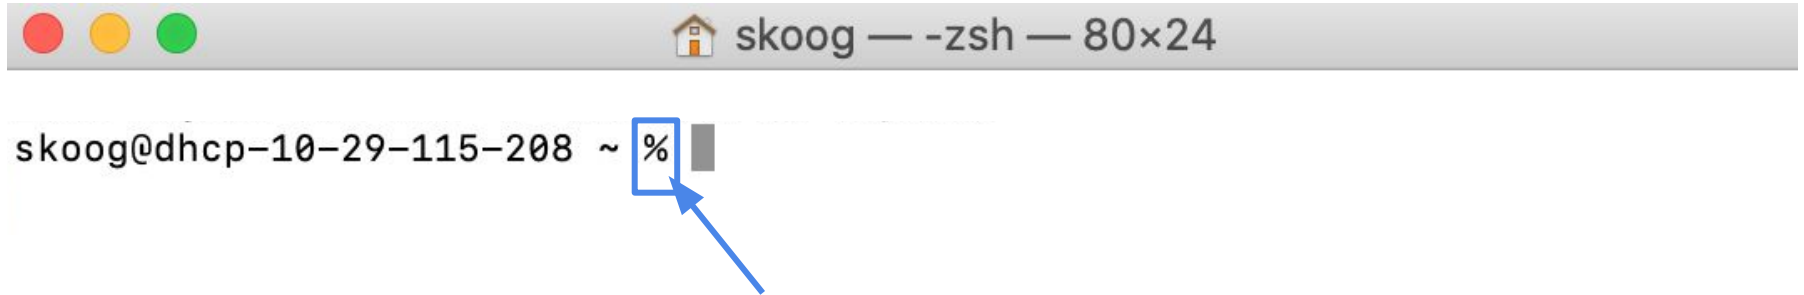

# Command line (sidenote)

Right after the \$ is where you start typing

A screenshot of a macOS terminal window. The title bar shows a folder icon, the text 'All\_MAGs copy', and '-bash' followed by the window size '93x32'. The terminal content shows the prompt '(base) emilieskoog@Emilies-MacBook-Pro-3:~/Desktop/All\_MAGs copy\$' with a red cursor. A blue box highlights the '\$' character, and a blue arrow points from the text box above to it.

```
(base) emilieskoog@Emilies-MacBook-Pro-3:~/Desktop/All_MAGs copy$
```

If you are running macOS Catalina on your computer, you technically have zsh instead of bash which just changes some things. In your command line, you have a % instead of \$

A screenshot of a macOS terminal window. The title bar shows a house icon, the text 'skoog', and '-zsh' followed by the window size '80x24'. The terminal content shows the prompt 'skoog@dhcp-10-29-115-208 ~ %' with a red cursor. A blue box highlights the '%' character, and a blue arrow points from the text box below to it.

```
skoog@dhcp-10-29-115-208 ~ %
```

Right after the % is where you start typing

# Some terminology recap:

Term	What it is
<code>shell</code> (or terminal)	what we use to talk to the computer; anything where you are pointing and clicking with a mouse is a <b>Graphical User Interface (GUI)</b> shell; something with text only is a <b>Command Line Interface (CLI)</b> shell
<code>command line</code>	a text-based environment capable of taking input and providing output
<code>Unix</code>	a family of operating systems (we also use the term “Unix-like” because one of the most popular operating systems derived from Unix is specifically named as <code>not being Unix</code> )
<code>bash</code>	the most common programming language used at a Unix command-line

# What is a directory?

- A **directory** is another word for 'folder.'

# What is a directory?

- A **directory** is another word for 'folder.'

directory

file

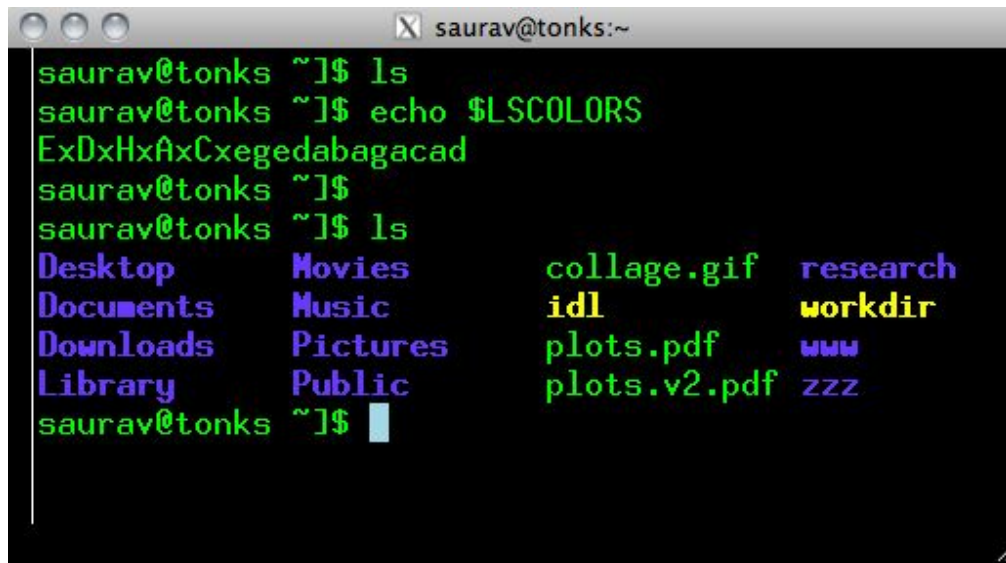

# Terminal aesthetics

- Depending on your terminal customizations, your files may or may not (aesthetically) look the same as your directories.
- For example, your directories could be bold and purple and your files could be green. You can customize these.

```
skoog@Emilies-Air Desktop % ls
Bioinformatics_summer_course_2021
Bosak_lab
Personal

Downloads    Pictures    plots.pdf   www
Library      Public     plots.v2.pdf zzz
saurav@tonks:~$
```

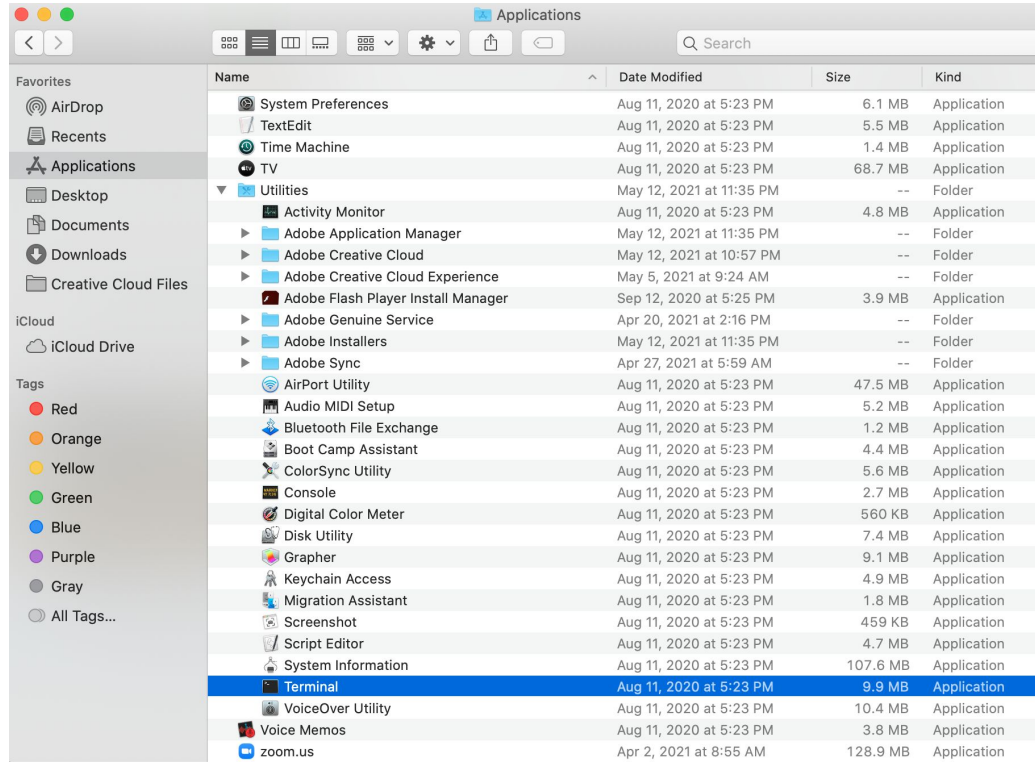

# Accessing our terminal to use the command line (mac)

Method #1: Find the Terminal using spotlight search bar

# Accessing our terminal to use the command line (mac)

Method #2: Find the Terminal by going to Applications folder > Utilities > Terminal

# Accessing our terminal to use the command line (Windows)

Follow this link (or google) for 10 ways to access your terminal on a Windows computer:

<https://www.howtogeek.com/235101/10-ways-to-open-the-command-prompt-in-windows-10/#:~:text=Open%20Command%20Prompt%20from%20the,open%20an%20administrator%20Command%20Prompt.>

# Let's use our terminal!

## Tasks

1. Check out your current directory (`pwd`)
2. Create a directory (`mkdir unix_practice`)
3. Go into this directory (`cd unix_practice`)
4. Create a file in this directory and write something in it (10 lines) (`nano file_1.txt`)
5. Print out first 5 lines (`head -n 5`)
6. Make another directory within this directory (`mkdir directory_1`)
7. Go into this directory (`cd directory_1`)
8. Make another file with 10 lines (`nano file_2.txt`)
9. Take the first 5 lines from this file and put it into another file named `file_2a.txt` (`head -n 5 file_2.txt`)
10. Take last 2 lines from this file and put it into another file called `file_2b.txt`
11. Look at `file_2b.txt`
12. Now look at all the files in your directory (`ls`)
13. Go back to the previous directory (`cd ..`)

# Demonstration of the power of Unix

# Summary of terms

- **Unix:** computer's operating system
- **Bash:** programming language used in Unix
- **Terminal (shell):** where you talk to your computer and execute commands
- **Command line:** the line where you write your commands in the terminal
- **CLI vs GUI:** command line interface (terminal) vs graphical user interface
- **Directory:** a folder

# Command summary

**mkdir** - **make a directory**

**cd** - **change directory**

**ls** - **list** out what is in your directory

**pwd** - **print working directory** (to see where you are on your computer, for example)

**mv** - **move** a file

**cp** - **copy** a file

**rm** - **remove** a file or directory

**less** - view contents of file

**head -n 5 file.txt** - lists first 5 lines of file.txt

**tail -n 5 file.txt** - lists last 5 lines of file.txt

**nano** - create a new file and edit existing files

**Tab completion** - hit tab after typing out part of a file or directory and it will complete the name if it is unique (avoids typos)

**../** Allows you to move between directories
